GymPassJUST test report

1 November 2026 | Current QR attendance revision

Automated result

30 tests passed. Backend statement coverage: 93.89%. Branch coverage: 86.23%. The minimum statement threshold remains 70%.

Passing cases include active and expired memberships; wrong or missing class booking; wrong instructor; signed, expired and tampered QR; duplicate scans; the exact class start/end boundaries; absence only after class end; idempotent payment; duplicate active-plan rejection; FIFO waiting-list promotion; local accounts and language conversion; class cancellation by instructor/manager; 24-hour timetable hiding; and safe legacy fixture cleanup. The jsQR test decodes the same QR format generated by the application.

Real browser checks confirmed instructor QR success, rejection for an active unbooked student, and rejection for an expired subscription. The revised browser checks also confirmed both cancellation buttons, automatic pass refresh after 32 seconds, and a successful scan of a 102-second-old QR. Camera hardware and a full independent browser/security/accessibility review remain open.

Load and recovery evidence

Simultaneous requests	Seats	Confirmed	Waiting	Errors	p95 ms
100	20	20	80	0	366.14
300	20	20	280	0	689.93

Environment: Windows, Node 24, single server, disk SQLite WAL and loopback HTTP. Sessions were pre-created. No TLS, proxy or internet latency is included. Backup/restore evidence is retained with its recorded date; it is not a live hosting test.

Limits and reproducibility

Run npm test and npm run test:load. Raw evidence is in evidence/. Dependency versions are locked; runtime audit records its actual date. Payments are simulated and university identity is separate. No five-person usability study, production availability window, external acceptance signature or physical camera test is claimed.
